By American Institute of Engineers

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 272 pages. Dimensions: 9.7in. x 7.4in. x 0.6in. This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1909 edition. Excerpt: . . . are included in the estimate. Both have been demonstrated to be practicable, and undoubtedly should be considered in any estimate made of the available water power resources of the country. Using the smaller figure of 30, 000, 000 h. p. as an illustration, to develop an equal amount of energy in our most modern steamelectric plants would require the burning of nearly 225, 000, 000 tons of coal per annum, and in the average steam engine plant, as now existing, more than 650, 000, 000 tons of coal, or 50, in excess of the total coal production of the country in 1906. At an average price of 3. 00 per ton it would require the consumption of coal costing 2, 000, 000, 000 to produce an equivalent power in steam plants of the present general type. The supply of water power is limited, however,...
